

DSIS Solutions now supplies and installs the UK Designed and Manufactured Redetec fire suppression products. Redetec is the only in-cabinet fire protection solution which puts all of the best fire detection and protection tools where the risk of fire and the threat to business continuity is greatest, in the equipment cabinet itself.

The traditional method of fire protection of IT & electronic equipment is to totally flood the room with a gaseous fire extinguishant. Whilst adequate in many situations, there are occasions where faster, more responsive detection is required to protect the high value and mission critical systems on which the company relies. Companies also prefer to use extinguishant gas more carefully and in smaller amounts, demonstrating a more responsible environmental policy as well as reducing project costs.

Redetec provides fire detection and extinguishant release within the protected enclosure, where a fire can be detected early; and where fire extinguishants can be applied directly.

### Computer Rooms and EDP Areas

As computers and electronic processing becomes more critical to businesses worldwide, the fire protection of computer rack enclosures is increasingly crucial. Redetec puts fire detection and extinguishing gas suppression inside each enclosure for faster, more responsive system protection. Redetec is an easy to install, design free fire protection solution for computer rooms and all types of data processing areas.
